Attention: Mr. Gordon Wray  
Chair, Northwest Territories Water Board

Dear Mr. Wray:

**Re: Annual Monitoring Report for the Umiak N16 Sump, 2005  
Licence N7L1-1797**

Enclosed please find a report of the inspection and monitoring conducted at the Umiak N-16 sump site in 2005 and the supporting Environmental Imaging (EM) report by Essis Ltd. This information is being submitted as required under Conditions Applying to Abandonment and Restoration (Part H) of water license N7L1-1797.

If you have any questions or require additional information, please do not hesitate to contact me.

Best Regards,

Sandra Marken, Environmental Advisor

**REPORT FOR THE ENCANA CORPORATION**  
**UMIAK N-16 SUMP MONITORING PROGRAM**

**SUBMITTED TO:** Northwest Territories Water Board  
P.O. Box 1500, Goga Cho Building  
Yellowknife, NT X1A 2R3

**Water License:** N7L1-1797

**Licensee:** EnCana Corporation

**Submitted by:** Sandra Marken, Environmental Advisor

**Year Reported:** 2005

This is the second annual report for the Umiak N-16 Sump Monitoring Program. The information in this report is required under Part H Conditions Applying to Abandonment and Restoration of the Northwest Territories Board w-License N7L1-1797 for the EnCana Corporation Burnt Lake (Umiak N-16) Drilling Program.

The first annual report contained information from the 2004 Umiak Sump Monitoring Program. At that time, no issues or concerns were reported.

The sump monitoring program includes;

- Visually assessing the sump site
- Downloading and recording temperature data logged at four thermisters, and;
- Conducting an electromagnetic (EM) survey.

In 2005 the Umiak Sump site was visited in April to download the thermisters, in September to conduct the EM survey and again in October to conduct a visual assessment and to download the thermisters. This report provides the results from these monitoring activities and compares these results with those of 2004.

**Visual Assessment:**

A visual assessment was conducted by Kavik-AXYS on October 21, 2005. This assessment is augmented by observations made by ESSIS when conducting the EM survey at Umiak N-16 in September. As in 2004 the sump appears to be functioning well. There was no evidence of ponding, erosion, stress or tension cracks or soil slumping on the surface of the sump. There was also no evidence of further settling observed at the site. Vegetation is continuing to become established on the sump surface although still patchy in some areas. Vegetation surrounding the site showed no visual

signs of stress. Some ponding and saturated ground was observed in areas surrounding the sump particularly to the south and north, related to saturation and polygon formation, as noted by both Essis and Kavik-Axys staff. This may be due to increased precipitation levels in the area in 2005 (Environment Canada weather data, 1950-2005). Photographs of the sump are provided in Figures 1 and 2.

### **Temperature:**

Four thermisters have each been monitoring the temperature at 12 different depths in and outside of the sump since April 30, 2004. Thermister 1726 is the control thermister and thermisters 1725, 1727 and 1728 are all located in the sump. Location and identification of thermisters are shown in the electromagnetic survey maps in this report. Results from April 30, 2004 to September 2004 were presented in the 2004 *Umiak N-16 Sump Monitoring Program Report*. In 2005, data was downloaded from the thermisters on April 26 and October 21, 2005. Temperatures are recorded twice daily, at 0000 and 1200, and averaged for the month. The temperature profiles in the sump area are continuing to align more closely with the control site profile. See Appendix A for the graphs comparing the monthly averaged data from the thermisters from September 2004 to September 2005.

The depths of the sensors on the thermisters have been adjusted to reflect the settling of the sump originally documented in the 2004 *Umiak N-16 Sump Monitoring Program* report.

Data from thermisters 1726 and 1727 appeared to have been corrupted between August 4 and 13, 2005. After consulting the company supporting the thermisters, the corruption of the data can occur from temporary battery issues, CB radios, activity in the area, and other causes. EnCana did not operate equipment in the area at the time the data was corrupted. Since the thermisters corrected themselves, it was determined that no follow up investigations were necessary. Corrupted data was removed prior to generating the average monthly temperatures for the two thermisters in August. The raw temperature data is located in Appendix B and the corrupted data has been highlighted in the database.

### **Electromagnetic Survey (EM):**

Essis Ltd. conducted electromagnetic surveys on September 19, 2005 using a Geonics EM31 and EM38 ground conductivity meters. These instruments were used to identify the lateral extents of ion-rich regions which may reflect ion contamination from the sump and help identify the need for any additional sampling. Readings from the EM 38 approximate measurements of the top 1.5 m (shallow) of topsoil while the EM31 approximates measurements of the top 5 m (deep) of topsoil.

EM surveys showed similar conductivity distributions as the previous year suggesting drilling wastes are still concentrated along the central axis of the visible sump area. Elevated responses paralleling the southern and northern sides of the topographic high of the sump were noted and may be influenced by increased water saturation. Elevated

readings from the EM 38 survey were noted below the southeast corner of the sump in 2004, and appear to have increased in 2005 (Figures 3 and 5). Higher EM readings can be attributed to high levels of saturation, high ion concentration, fine sediments and other causes. The patterned ground in the vicinity of the high EM 38 results south of the sump indicate saturated ground, which may contribute to higher conductivity values. Elevated responses of conductivity are more apparent in the shallow EM38 surveys than from the deeper EM31 survey, again suggesting that saturation at the surface may be a factor.

### **Conclusions and Recommendations:**

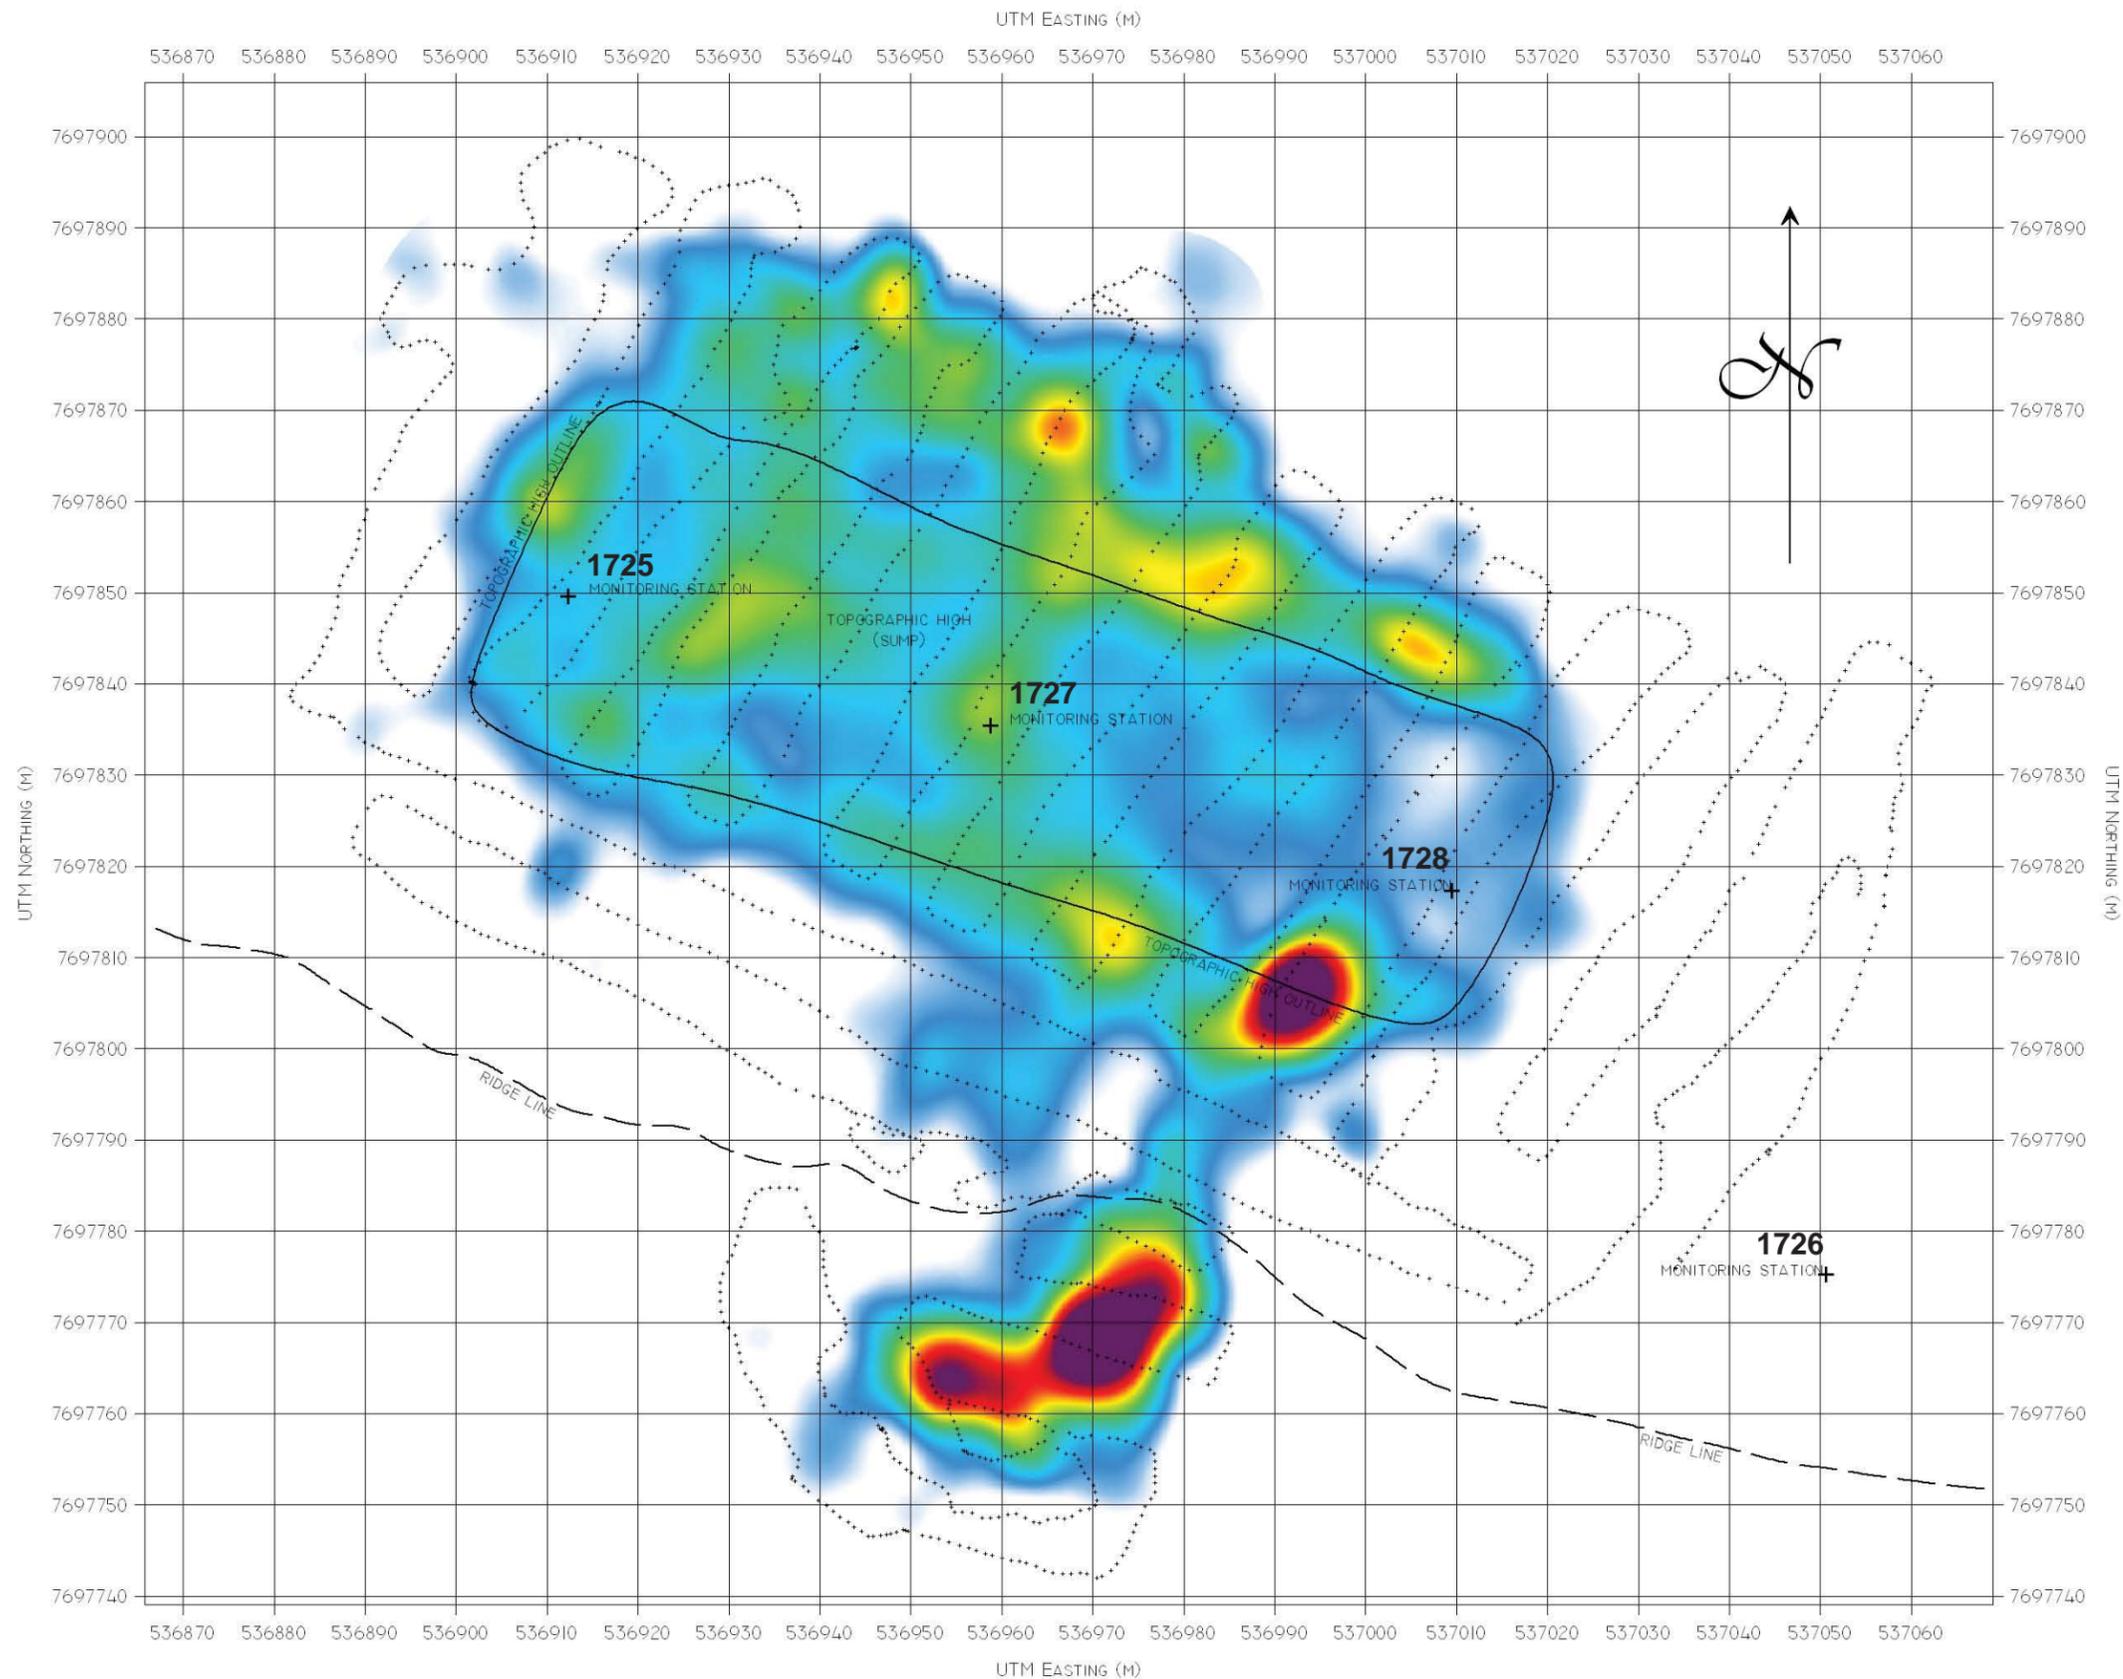

Visual and temperature results suggest the sump is stabilizing. Temperatures within the sump are more closely aligning with the control site than in 2004. There was no evidence of any further settling and vegetation is continuing to take hold over the surface of the sump. The EM 38 survey indicates some potential changes in conductivity responses along the north and south sides and below the southeast corner of the sump. A variety of factors can influence these responses and it is recommended that soil and surface water samples be collected in conjunction with the EM surveys in the summer or fall of 2006 to assist in interpreting the EM results.

**SITE LOCATION MAP**

**COMMENTS**

THE COLOUR IMAGE REVEALS THE 'APPARENT CONDUCTIVITY DISTRIBUTION' ON SITE. THE TERM 'APPARENT CONDUCTIVITY' IMPLIES THAT CONDUCTIVITY MEASUREMENTS DO NOT LINEARLY RELATE TO ACTUAL SOIL CONDUCTIVITIES.

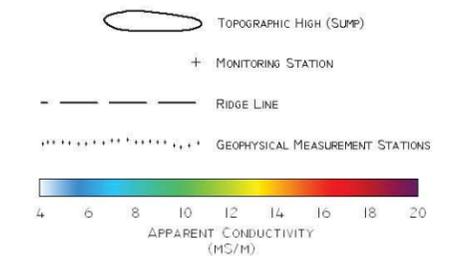

THE PRESENTED EM DATA SHOULD BE USED QUALITATIVELY TO SELECT TARGETS FOR VERTICAL (DEPTH) GEOPHYSICAL PROFILING OR SOIL SAMPLING. GEOPHYSICAL RESULTS ARE ONLY CONCLUSIVE AFTER CORRELATION TO SOIL SAMPLE DATA (GROUND-TRUTHING). THE DEPTH RESPONSE OF THE ELECTROMAGNETIC (EM) FIELD VARIES FROM SURFACE TO A UNIQUE DEPTH, THE 'SKINDEPTH' OF THAT PARTICULAR EM SIGNAL. THE SKINDEPTH OF ANY EM SIGNAL IS STRONGLY INFLUENCED BY OVERALL SOIL CONDUCTIVITY. SINCE SOIL CONDUCTIVITY VARIES RANDOMLY, THE APPARENT CONDUCTIVITY DISTRIBUTION DOES NOT REPRESENT DATA FROM ANY PARTICULAR DEPTH.

POSTED FEATURES ARE SURVEYED USING DGPS. A POSITIONAL ACCURACY OF SEVERAL DECIMETERS IS GENERALLY POSSIBLE. POSITIONAL ACCURACY DIMINISHES NEAR LARGER BUILDINGS AND OTHER SATELLITE-OBSTRUCTING FEATURES.
